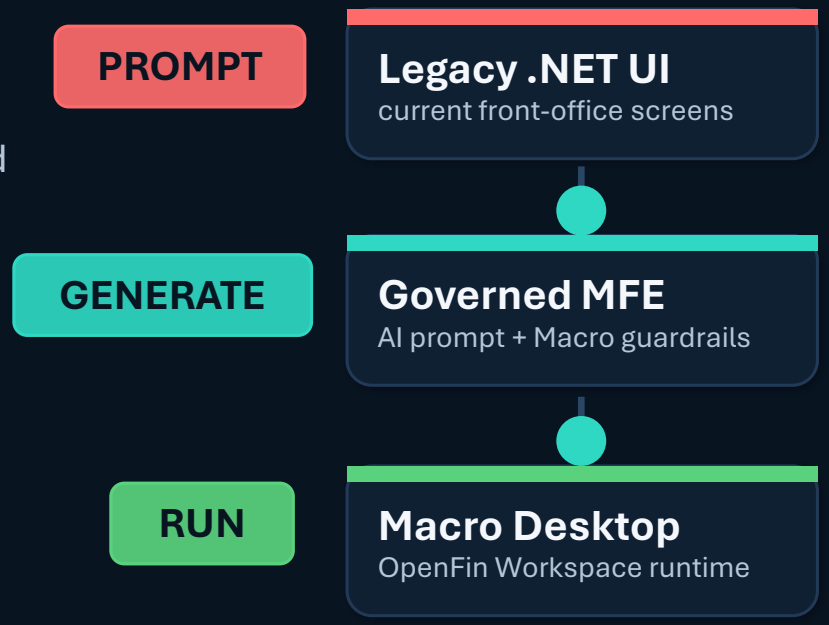
Agentic AI for Macro Front Office UI Transformation

From legacy .NET screens to governed Angular/React micro frontends hosted in Macro Desktop

Faster modernization comes from prompt-based prototyping, governed reuse, and automated deployment into the desktop runtime.

Presentation focus

How Figma Make + Macro MCP Server + Macro MFE Libraries create a faster path from UI idea to production-ready MFE running inside OpenFin Workspace.



Figma Make | Macro MCP Server | Macro MFE Libraries | GitHub | OpenShift | OpenFin Workspace

How the new agentic UI factory works

AI accelerates screen creation, while Macro design context, libraries, and platform hooks keep the output production-ready.

INPUT

1 Prompt pack

Legacy .NET screen workflow + data needs

AI DESIGN

2 Figma Make

Prompt → prototype layouts, states, flows

GOVERNED BUILD

3 GitHub MFE repo

Agent scaffolds Angular/React code, tests, docs, PR

DEPLOY

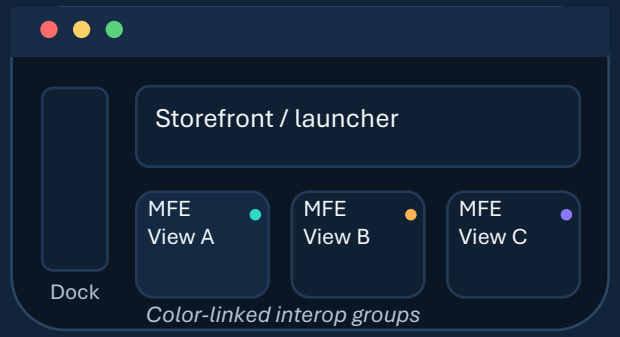
4 OpenShift

Build • scan • deploy internal cloud

RUN

Macro Desktop

OpenFin Workspace host for the new Angular/React MFEs



Storefront | Dock | **Interop + color linking**

grounded by Macro assets

Shared accelerators that remove boilerplate

These assets ground the agent and standardize the generated MFE.

Macro design context
themes • colors • UX rules

Macro MCP server
patterns • API contracts • templates

Macro MFE libraries
logger • auth • ag-Grid • shared components

Less greenfield coding
boilerplate is scaffolded or reused

Standardized UX
theme + components stay aligned

Fewer handoffs
design to code moves in one flow

Desktop-ready delivery
deployment and hosting are built in

One-page task outline for the new approach

Human review gates stay in place, but more of the work is standardized, reusable, and agent-assisted.

1 Intake & prompt pack

Product + UX

- Capture the .NET /Legacy screen, workflow, and success criteria
- Define API/data, entitlements, and Angular/React target
- Attach Macro themes, components, and UX rules

2 Prototype in Figma Make

AI + UX

- Prompt the first-pass UI and interaction states
- Iterate layout, copy, and flows with the business team
- Freeze approved frames for code generation

3 Generate the governed MFE repo

AI + FE

- Use the Macro MCP server for standards, API contracts, and templates
- Create the GitHub repo, routes, tests, docs, and PR
- Scaffold OpenFin registration hooks where needed

4 Compose with Macro libraries

Frontend Eng

- Apply logger, auth, ag-Grid wrapper, and shared components
- Replace generic UI with Macro tokens and theme behavior
- Wire domain logic, services, and interop events

5 Automate build & deployment

Platform

- Run build, scan, and deployment pipelines in OpenShift
- Promote through environments and publish the MFE endpoint
- Capture versioning, release notes, and rollback points

6 Onboard into Macro Desktop

FE + Desktop

- Register the app in Storefront/Dock and validate launch
- Test interop and color-link context behavior in Macro Desktop
- Feed UAT and telemetry back into prompts for the next iteration

Human review gates stay in control: UX fit | Security / auth | PR quality | Desktop UAT

Net effect: the team spends less time rebuilding plumbing and more time validating workflow logic and user value.
